

FORTKNOXSTER COMPANY PRESENTATION

“Cybercrime is the greatest threat to every company in the world - and the threat only continues to grow“

Ginni Rometty, current executive chairman of IBM.

Our Vision Statement

To safeguard everybody's communications & data in cyberspace, by offering the world's most secure one-stop platform.

Why

Every year marks another “worst year ever” for cyberattacks around the world.

IBM recently estimated that the average financial impact of a data breach is about \$3.8 million. For companies at the enterprise level with at least a thousand employees, it can reach 10x or even 100x that number.

As hackers are getting more and more sophisticated, the risk of corporate hacks is growing every day. Some of the biggest risks of getting compromised are unsecure communications like sharing and receiving confidential information on plain-text emails, unencrypted chats, and the like. Hackers can very easily compromise these communications and steal data, inject malware, perform phishing attacks, etc. – the list goes on.

A few facts:

- There is a hacker attack every 39 seconds
- The global average cost of a data breach is \$3.8 million
- 43% of cyber attacks target small businesses
- Since COVID-19, the FBI reported a 300% increase in cybercrimes
- Approximately \$6 trillion is expected to be spent globally on cybersecurity by 2021
- 95% of cybersecurity breaches are due to human error
- Most companies take nearly 6 months to detect a data breach, even major ones
- Share prices fall 7.27% on average after a breach
- Total cost for cybercrime committed globally will reach \$6 trillion by 2021
- Unfilled cybersecurity jobs worldwide is already over 4 million

By using FortKnoxster for company communications and data storage, 99% of the above risks get eliminated. Peace of mind.

Team

FortKnoxster is founded by skilled Scandinavian entrepreneurs & IT security specialists, who all share a great passion for cybersecurity, blockchain, cryptography, and privacy for all. Our core expertise is developing secure communication platforms, based on the latest encryption technologies and highest standards available. Our team consists of highly skilled encryption and data security experts.

Our Technology

All calls, messages, and files sent and received in the FortKnoxster web and mobile app are end-to-end encrypted by default. When communicating on FortKnoxster, several cryptographic key pairs are generated on your local device to encrypt and decrypt messages and files. The private keys are protected with encryption keys derived from your password which is only known to you. When you connect with your contacts or other FortKnoxster users you exchange public keys securely, so that the person can encrypt messages to you and decrypt messages from you.

FortKnoxster uses a zero-knowledge authentication scheme in which the user's password never leaves the user's device, keeping you in control of your private keys and confidential security information.

FortKnoxster never transmits or stores passwords in plain text, as these are protected with a hash-based encryption for zero-knowledge authentication.

Solution

Are you looking for the most secure and private communication platform for your business? A platform that is easy to use for all and can even be branded in your business's own brand? You have come to the right place!

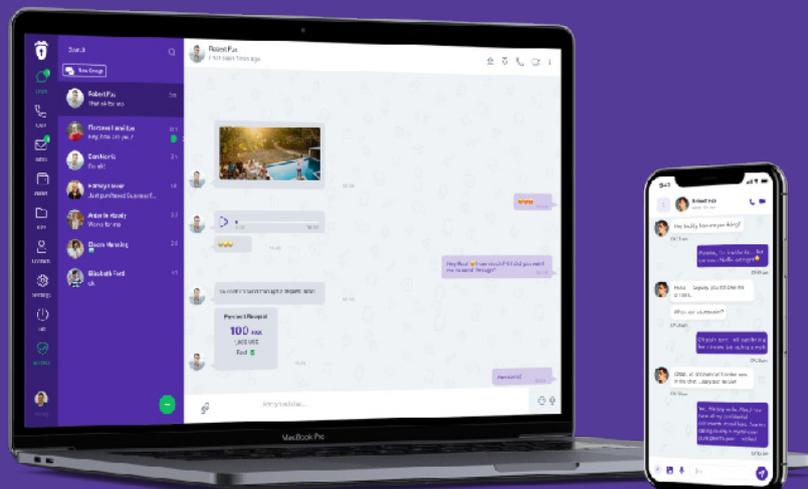

FortKnoxster is a cyber-security company offering a complete Crypto Suite™ of extremely secure messaging, calling, video-calling, cloud storage and screen-sharing for enterprises and businesses. We also offer an integrated crypto wallet (optional).

FortKnoxster uses strong military-grade encryption with advanced blockchain technology and zero-knowledge principles to protect all business communications, data, documents, etc.

FortKnoxster provides our secure communication and collaboration platform for all kind of businesses: SME, large enterprises, SMB, government agencies, NGOs, journalists etc.

Our platform can also be white-labelled as a reseller product to ie. cybersecurity companies, telcos and alike.

Our platform is easy to implement and can be used both on web and mobile apps.
